

# PROSPECT *EXPLORER*

# Neural Network Analysis

- Neural computers can:
  - Analyse large amounts of complex data
  - Identify relationships
  - Recognise patterns and associations
  - Make predictions automatically
- Powerful analysis tool
- Decision Support for the Geologist
- Orders of magnitude more time efficient than conventional methods

# Neural Computing

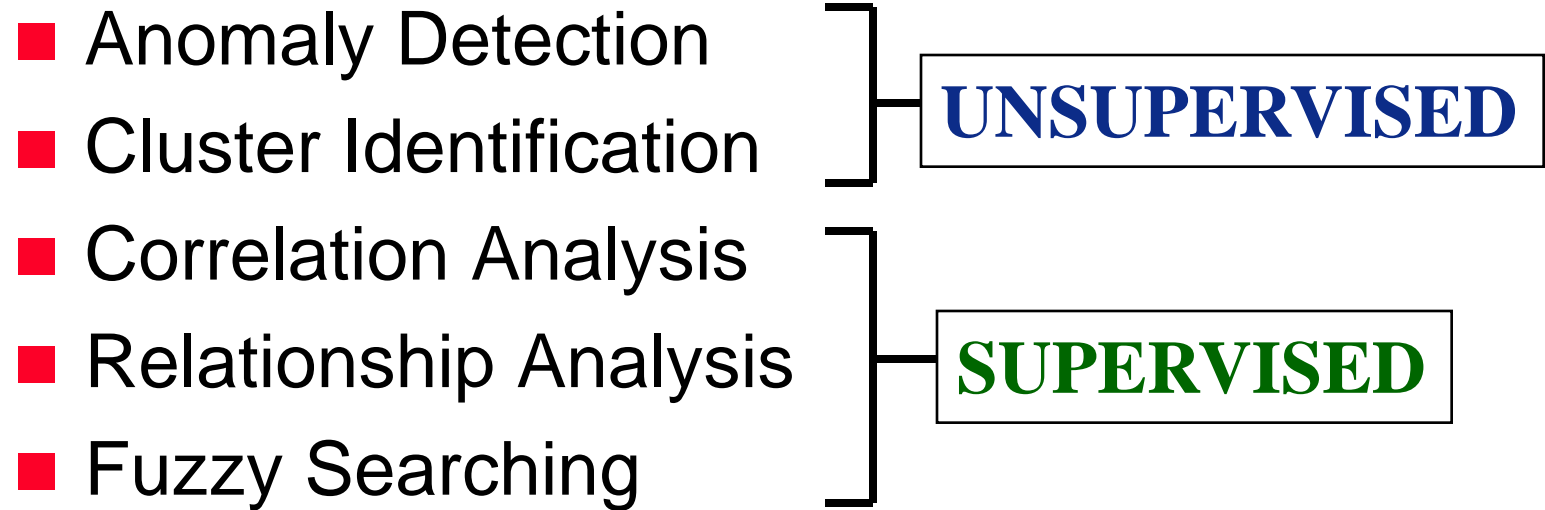

- Inspired by the biological processes of the brain
- Learns by example
- Generalises from experience
- Automatically produce predictions

# Types of Neural Networks

- Supervised:
  - Back propogation
  - Training data set provided and neural net learns from available data
- Unsupervised:
  - Feedforward
  - No training data and neural net required to learn and group from whole data set

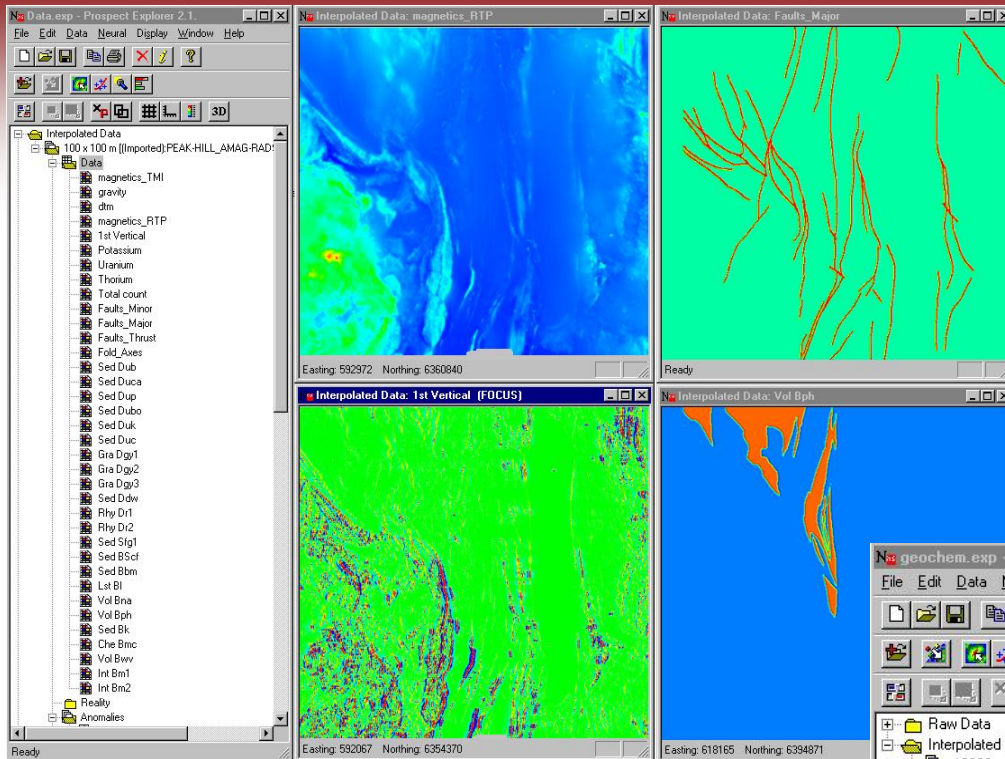

# Neural Analysis Techniques

Five types of neural analysis performed:

# Data Input

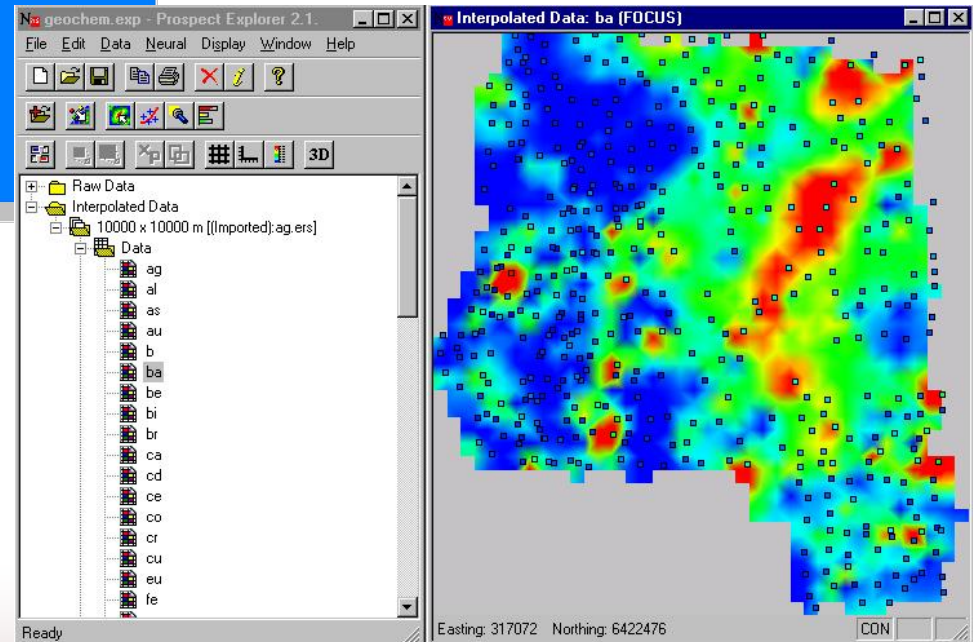

- Data Input
  - Gridded data – ascii, ER mapper, Geosoft, GIS
  - Geochemical, geological, geophysical, topographical, satellite etc.
  - Multiple DXF overlays
  
- Analysis Output
  - Image files
  - ER Mapper, Geosoft, MapInfo, ArcView

## Prospect scale soil sample data – 46 elements

Regional scale data layers:

- Airborne magnetics
- Structural – 1st order faults,
- Processed magnetics - 1vd
- Geology layers

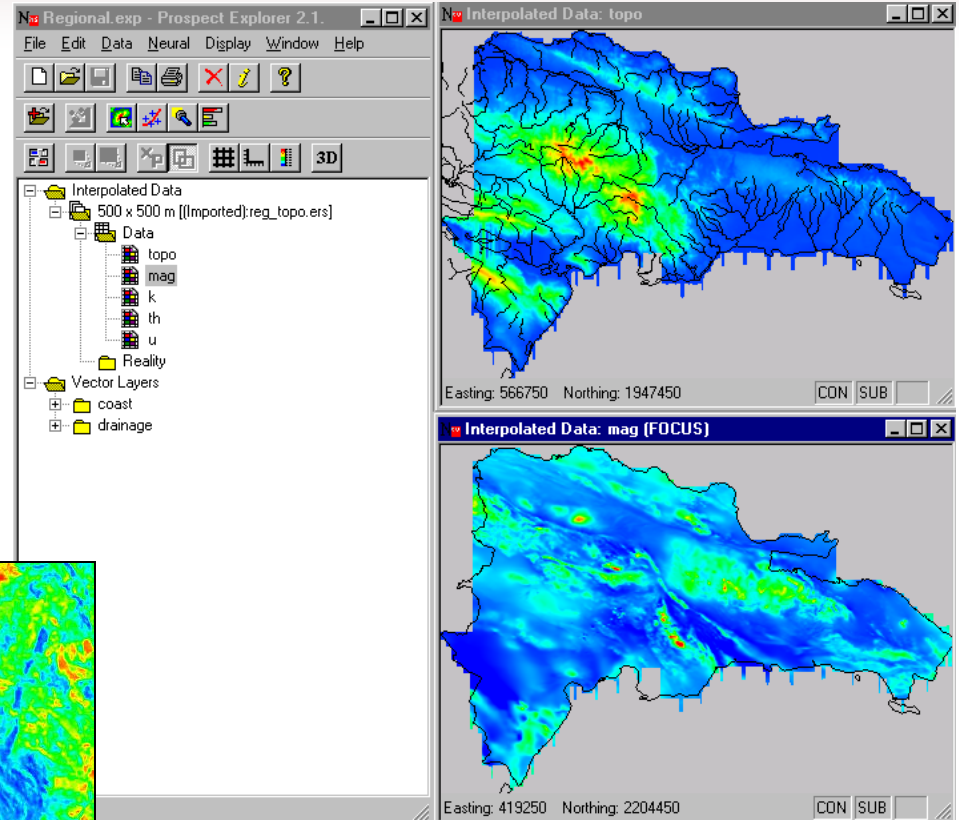

## Country scale data

- Topography
- Airborne magnetics
- DXF overlays

## Regional scale hyperspectral data

- clay
- silica

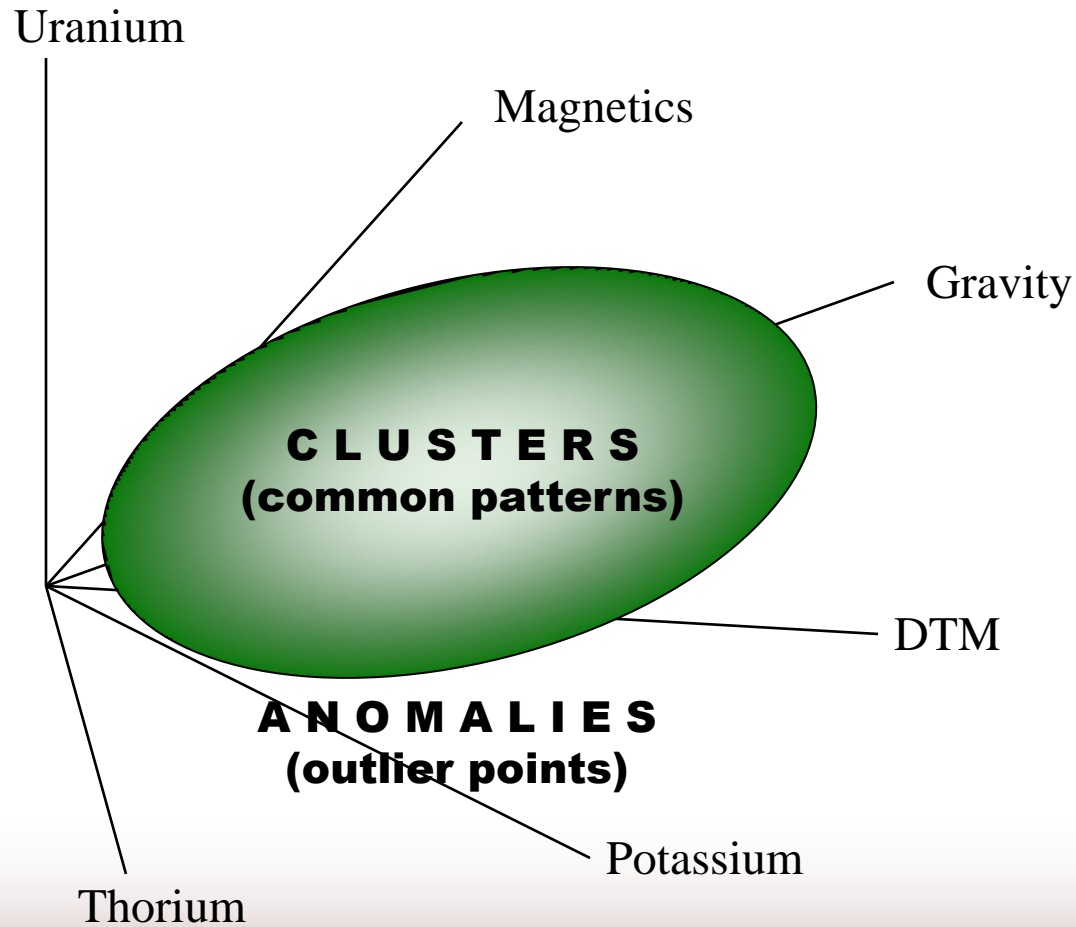

# Neural Anomaly Analysis

- Features:
  - Identifies regions that are anomalous
  - Evaluates *how* anomalous these regions are
  - Relates anomalies back to the data with the ability to interrogate each anomaly
  - Fully automatic operation
- Control by:
  - Selection of survey layers
  - Region of interest
  - Training duration

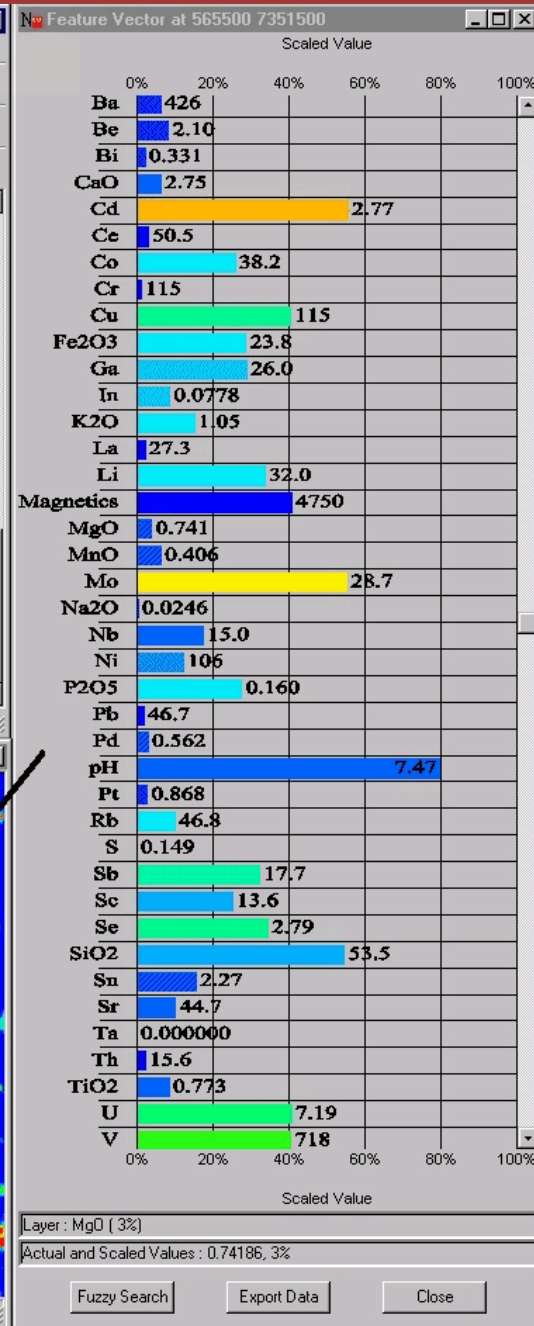

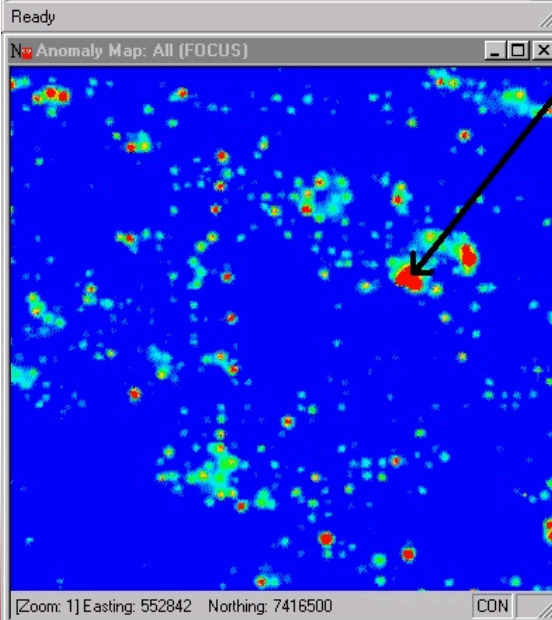

# Anomaly Detection

Prospect Explorer 2.1.

## Anomaly analysis

Feature vector plot shows the values at particular anomalies. The colour of the histogram indicates which data layers are the most significant in determining the anomaly.

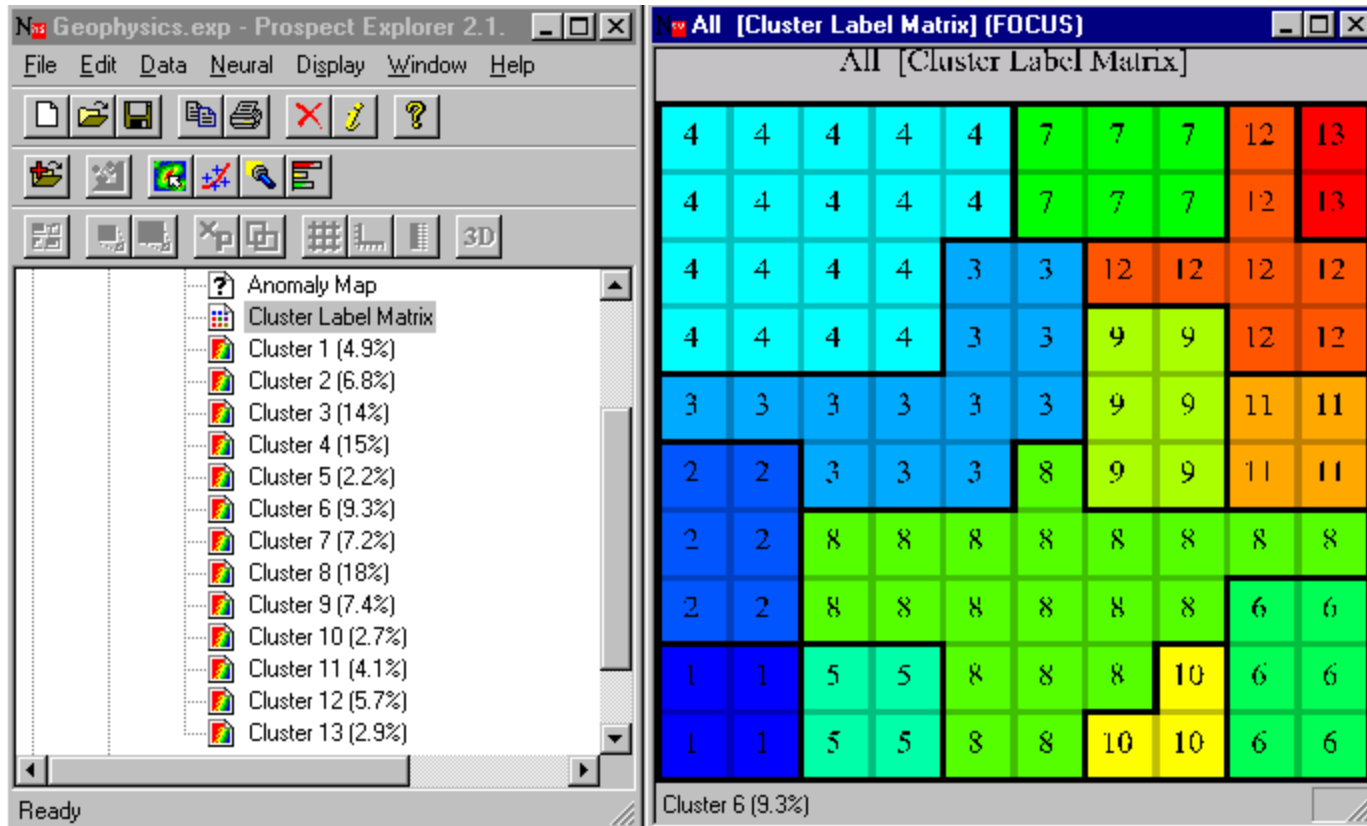

# Cluster Analysis

- Extraction of pattern groups
  - common pattern types eg lithology
  - character of each cluster type
- Aids geologist:
  - Visualising geoscience data
  - Evaluating types of patterns within survey site
  - Geoscientist can interpret clusters according to the geological setting e.g. lithology and alteration zones

# Cluster Identification

# Cluster Identification

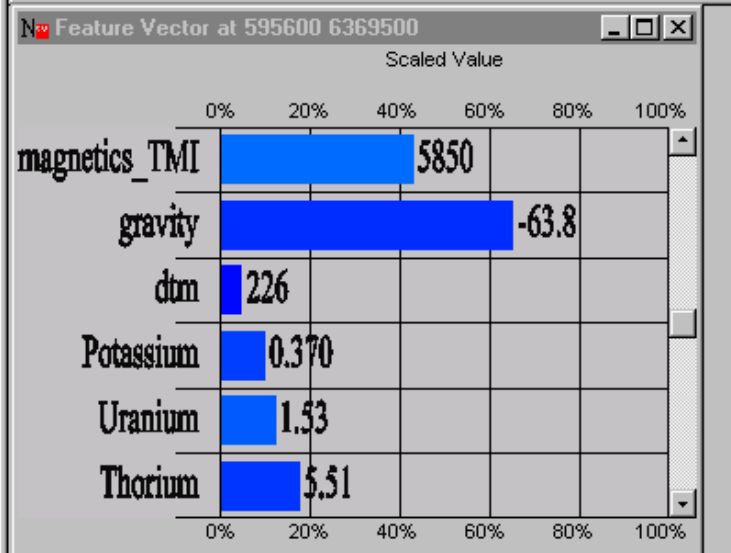

13 clusters identified in geophysical data

Granite Batholith

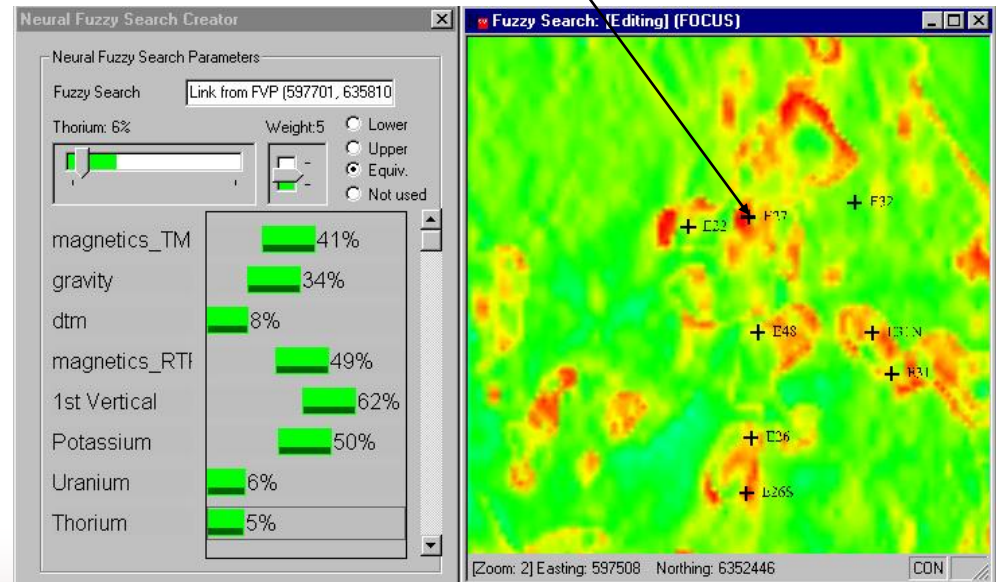

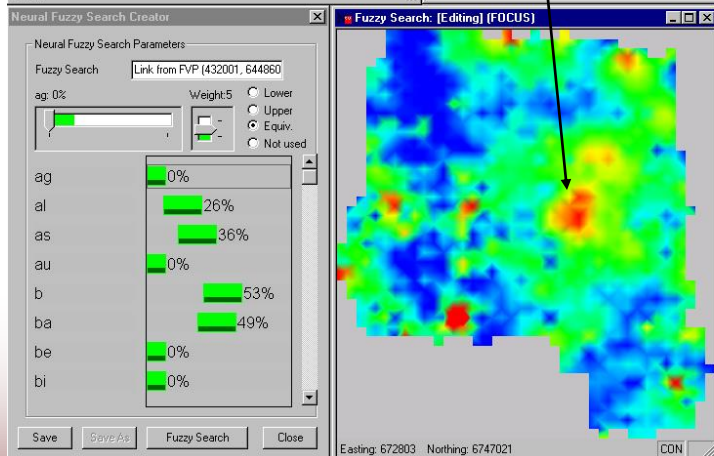

# Neural Fuzzy Search

- Specify search items
  - search a selected pattern eg. anomaly
  - search a particular location eg. known deposit
  - search for a “created” pattern - look for a particular deposit type signature
  - searches for a correlation signature
- Control by:
  - choose data layers to include
  - set the data threshold for each layer
  - control the weighting of each layer

Fuzzy search link from known mineral deposit to look for areas with a similar geochemical signature

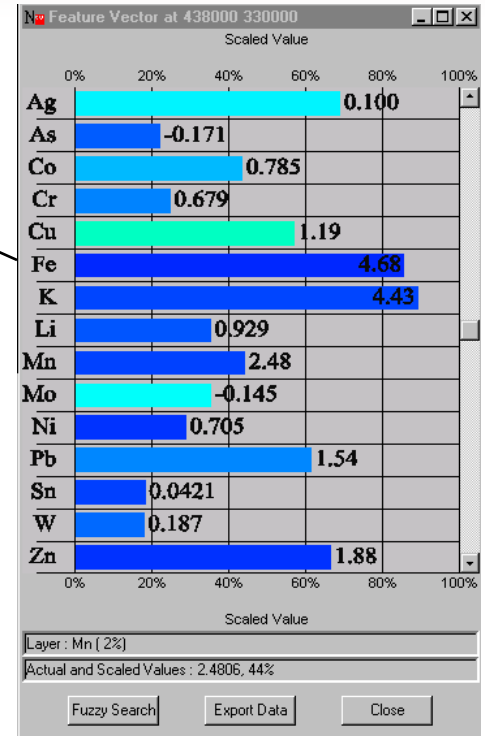

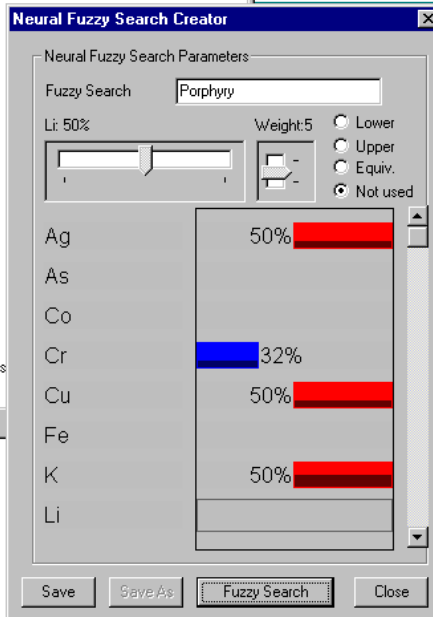

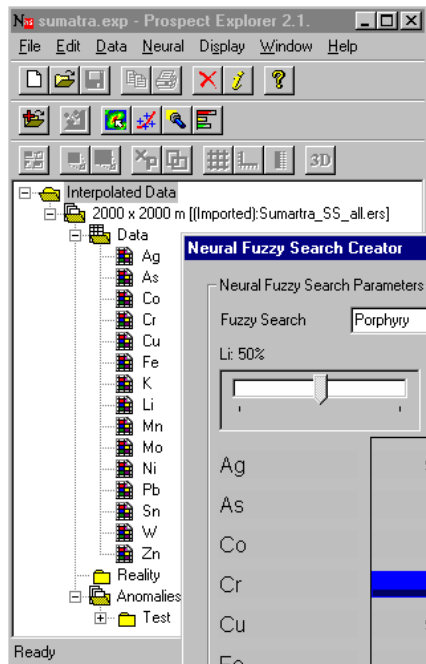

Neural Fuzzy Search using the North Parkes Endeavour 27 deposit as the search criteria

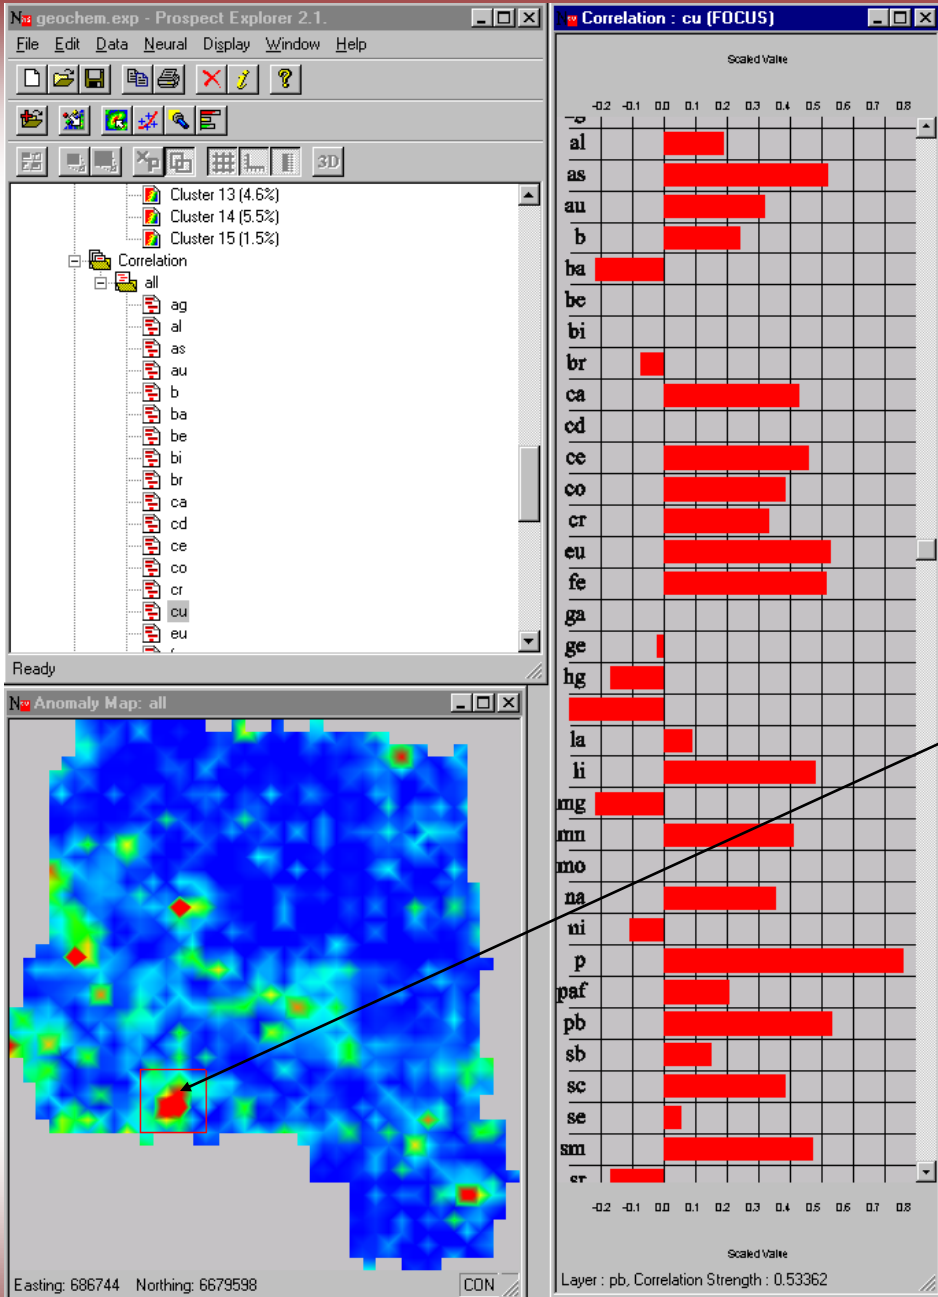

# Porphyry fuzzy search elevated Ag, Au, Cu, K, Mo low Cr, Ni

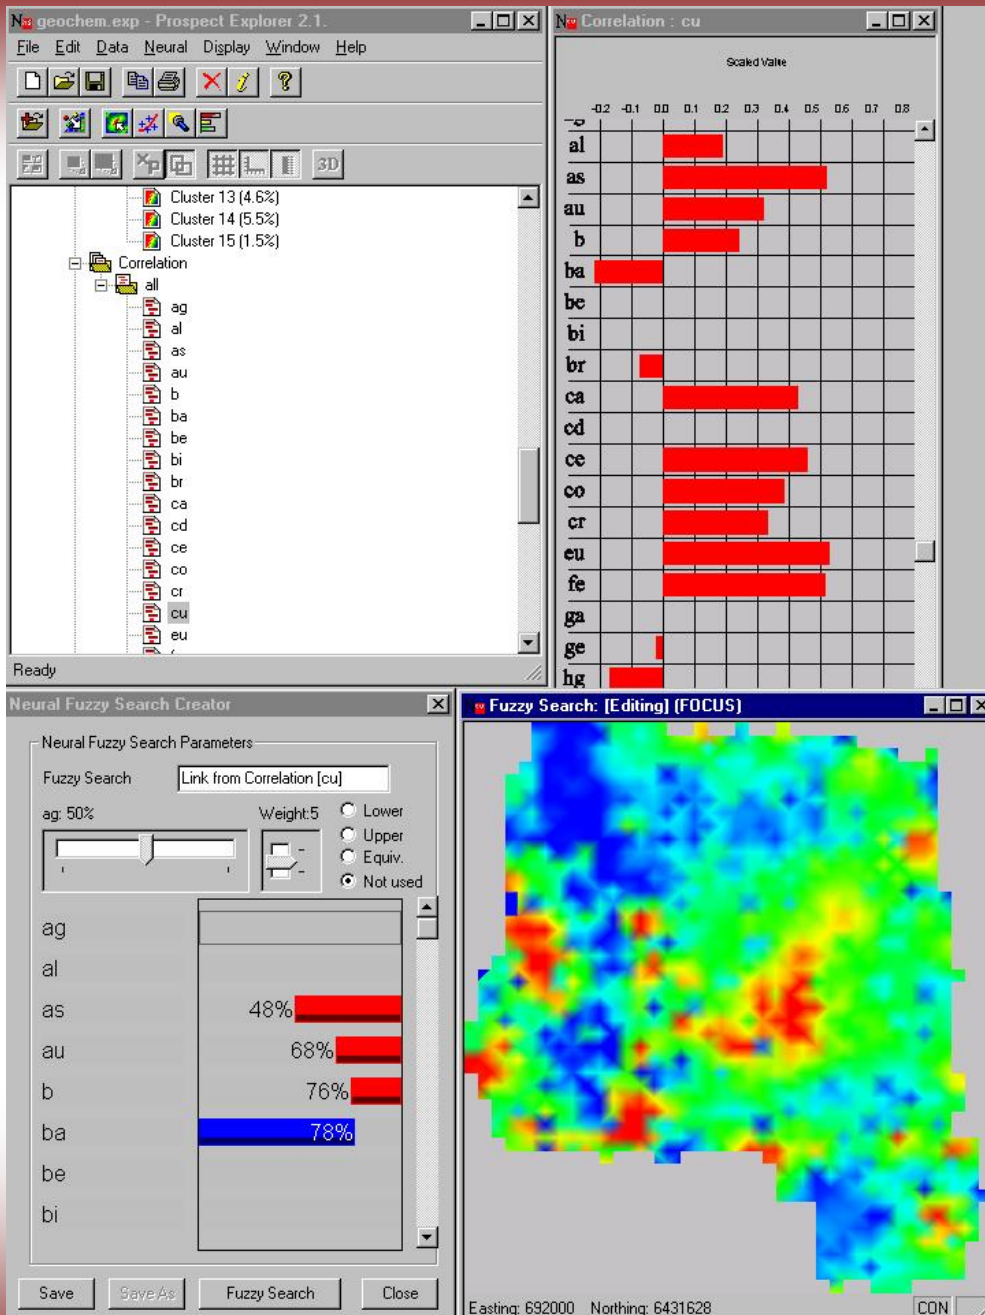

# Correlation Analysis

- Relationships between survey results
- Relational Knowledge
- Correlation signatures can be determined
- Search for areas with similar correlation signature ie search for similarities in relationships for population identification

Correlation of each elements with respect to Cu within a specified region of interest

## Correlation link to fuzzy search

This searches for signatures of the relationships between layers, independent of the amplitude values of the layers and so may detect anomalies in areas where the raw values are close to the detection limit but the associations are the same as the higher values in the region of interest.

# Relationship Explorer

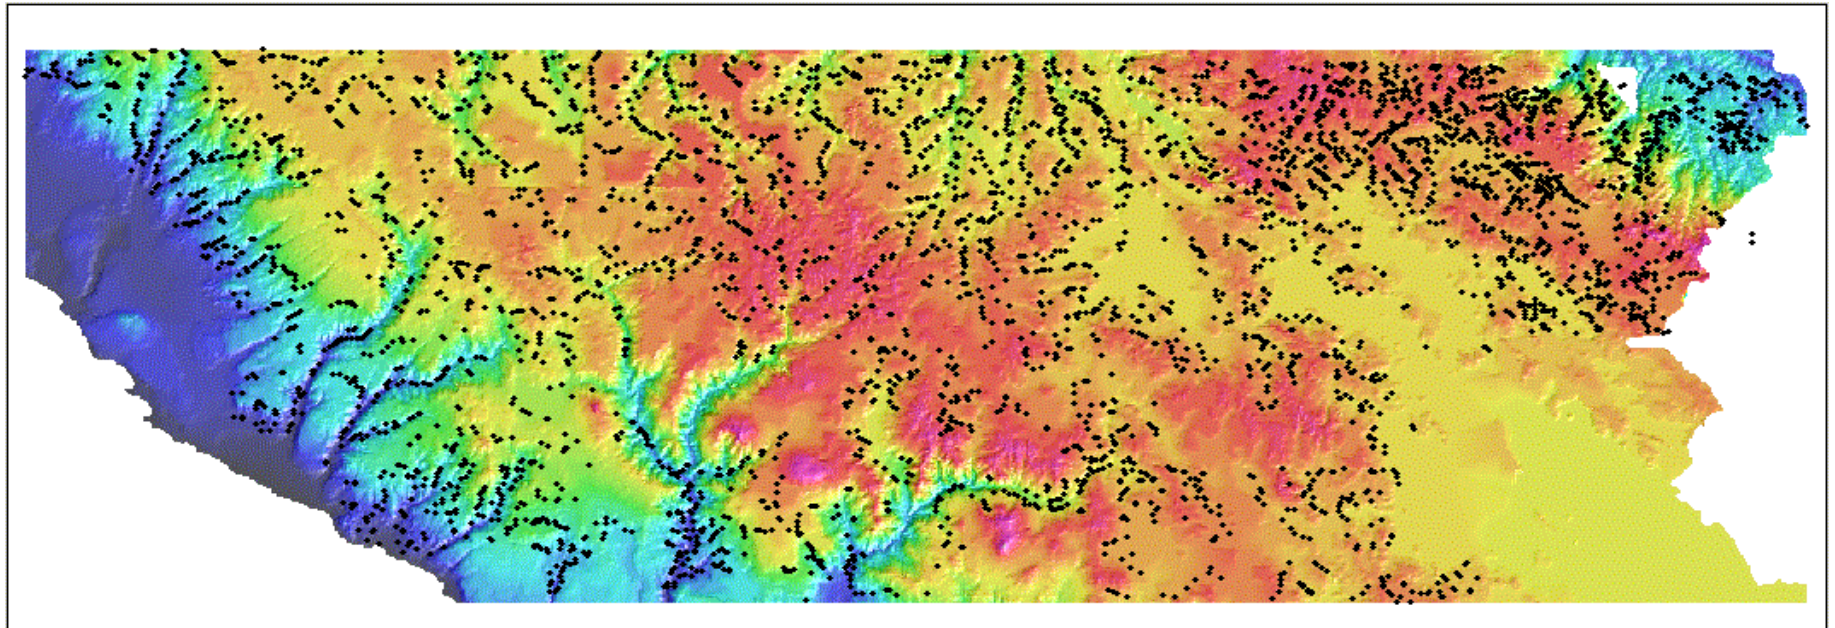

- Visual “Graphic Equaliser”
  - enables analysis of inter-channel responses as one channel varies
  - *allows more qualitative analysis of data*

# Rio Tinto Neural Analysis

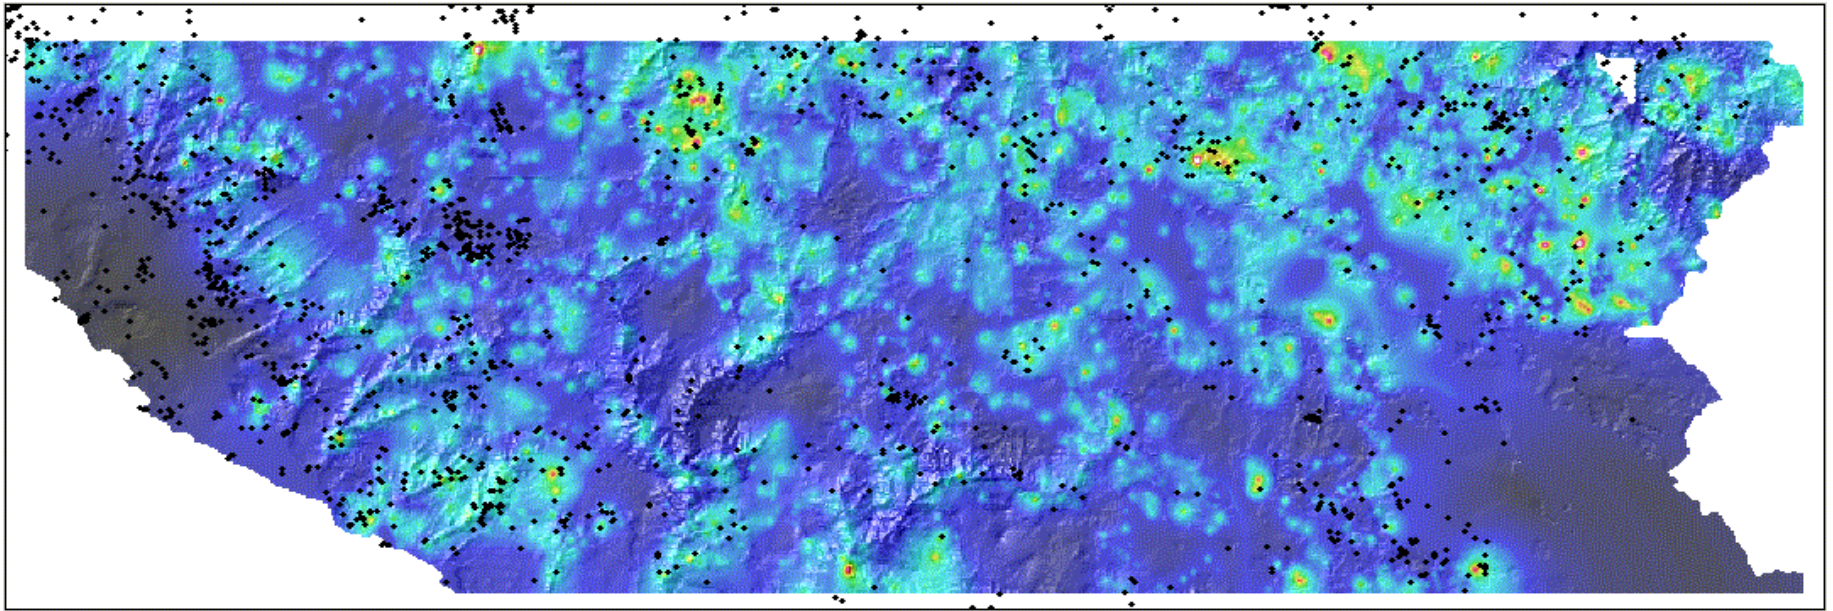

- Ingemet Southern Peru Data Package
- Geochemistry - 30 layers of stream sediment samples
- Mineral Occurences Database
- *Prospect Explorer* software
- Anomaly detection, cluster analysis, fuzzy searches and correlation analysis

# Sample Points

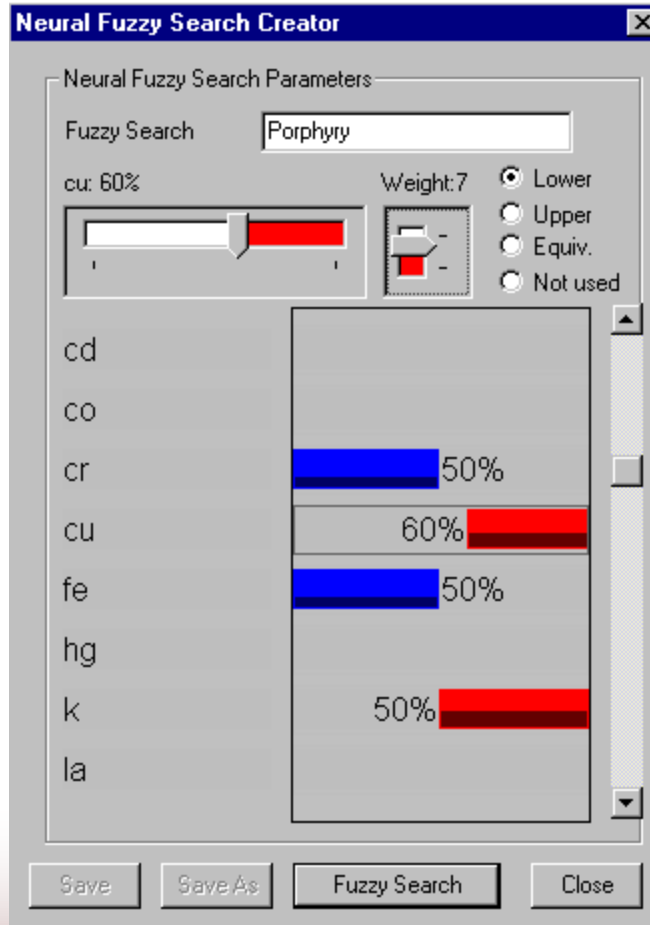

# Anomaly Analysis

Neural Anomaly Analysis – all elements with known mineral occurrences

# Fuzzy Search Creator

Porphyry search

>50% Ag-Au-Mo-Pb-Zn

>60% Cu high weighting

>50% K high weighting

<50% Cr-Fe-Ni

# Fuzzy Search Results

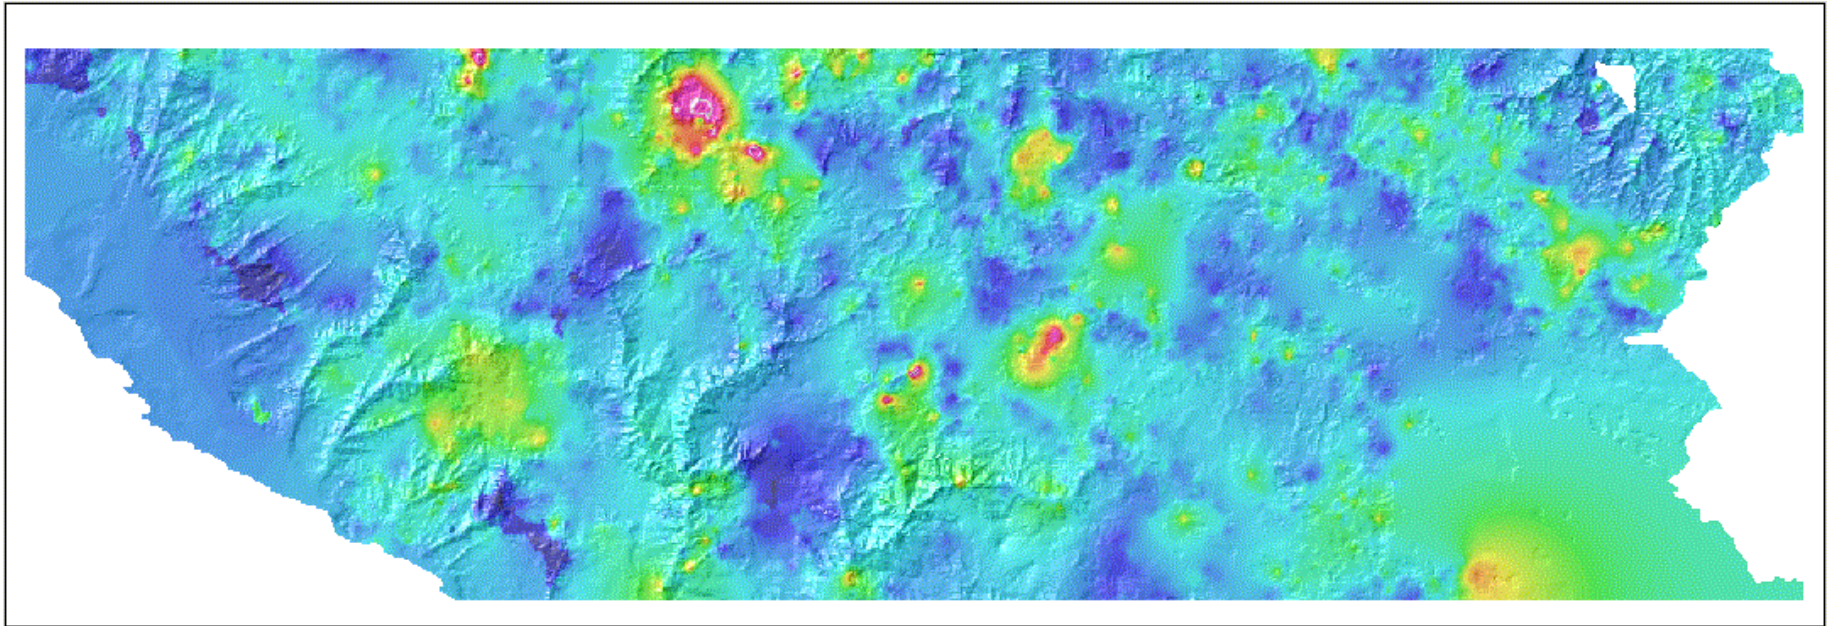

Porphyry search:            >50% Ag-Au-Cu-K-Mo-Pb-Zn  
                                 <50% Cr-Fe-Ni

Known major porphyry mines and deposits

# Fuzzy Search Results

Epithermal search: >50% Ag-Au-As-Sb

# Fuzzy Search Results

Mineralisation search: >50% Ag-Au-Cu-K-Mo-Pb-Zn  
>50% mineral occurrences

# Selwyn Neural Analysis
